

1. Eye annotations

Annotations of eye MRI scans include T1WI, T1WI+C, and T2WI sequences. The superior rectus muscle-upper eyelid lifting complex, lateral rectus muscle, medial rectus muscle, inferior rectus muscle, optic nerve, fat, lacrimal gland, superior oblique muscle, and eyeball were marked out, and different colors were assigned to different annotations, as shown in the figure below.

2. Breast tumor

Annotations of breast MRI scans include DWI, T1WI+C, and T2WI sequences. We can provide a series of services, from tumor annotations, to feature extraction and selection, to establish the model, and model validation according to the research direction.
